Atomic vs. mixed: action training loss

Both evaluated checkpoints use no alignment. Atomic: complete logged history; mixed: recovered tail only.

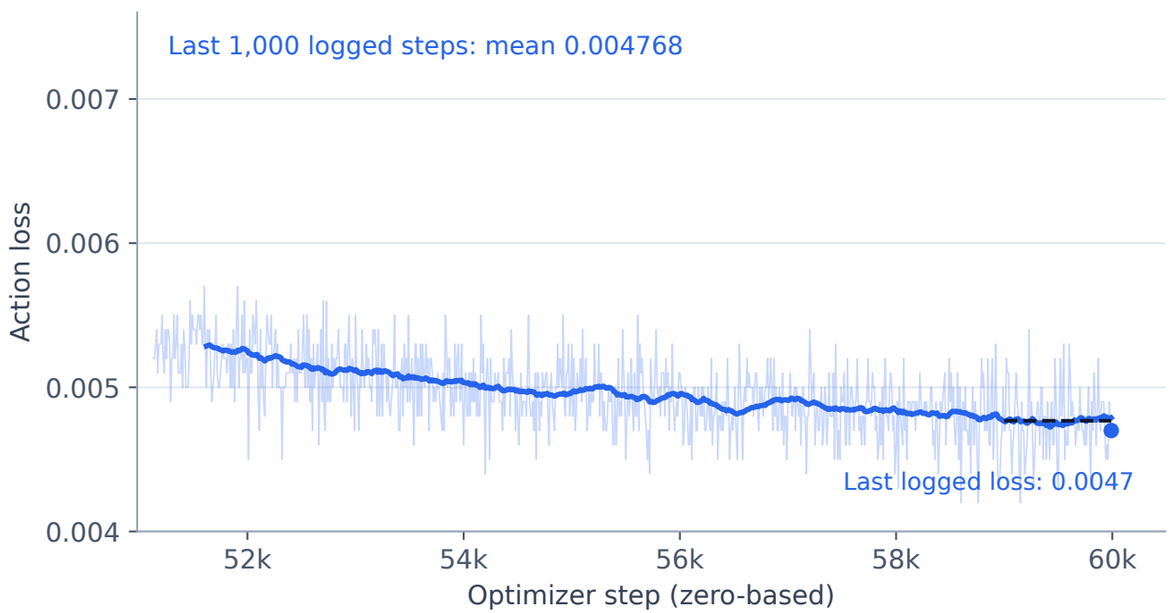

A Atomic: full logged history

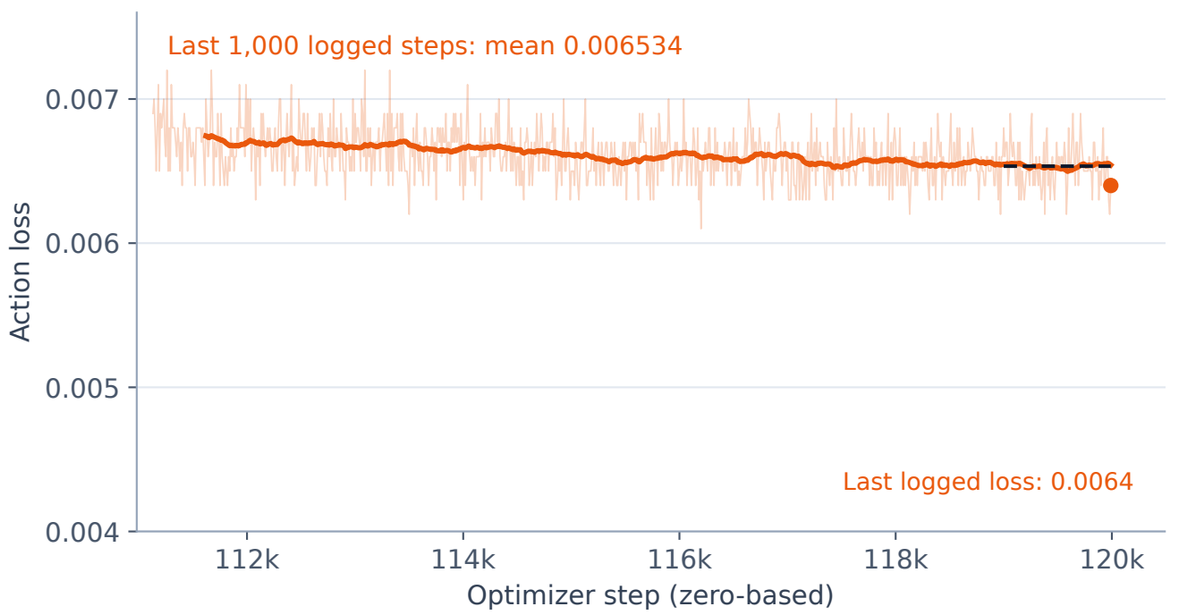

B Mixed: recovered coverage

C Atomic: final logged segment

D Mixed: final logged segment

Light lines: rounded training logs. Dark lines: 50-record moving average. Bottom panels share the same y-axis scale.

Datasets and quantile normalization differ. These are training losses, not validation losses or success rates. Final 9 updates have no loss log.
